The following time series have been compiled to assist the members of the Institutional Adaptation on Climate Change (IACC) project investigators. Although the study area is limited to the South Saskatchewan River Basin of the provinces of Alberta and Saskatchewan, provincial-level data remains useful in determining the impact of climate (as opposed to other factors such as the price of commodities) on agricultural output and the provincial economies in question. Data on Manitoba are included mainly as a comparator.

There are two tables for each province: the first provides selected economic and demographic data while the second brings together key agricultural indicators. In the provincial agricultural tables, since wheat production and wheat yield data time series are of high quality, they are sometimes used as a proxy for grain production and grain yields. Price data are included in order to allow investigators to separate price effects from yield effects with climate playing an important role in determining yield outcomes.

## Economic/Demographic Time Series for Alberta, 1905-2005

'Farm population' refers to all persons who are members of a farm operator's household, living on a farm in a rural or urban area.
ii 'Improved farmland' comprises land under crops, improved pastures and summer fallow.
iii Principal field crops for all three Prairie Provinces include wheat, oats, barley, rye, peas, flax, potatoes, turnips, hay, clover, fodder corn and alfalfa.
iv 'Wheat' as defined here includes spring wheat, winter wheat and durum.
Gross Farm Income: Income from farming operations that is immediately available for farm expenses, family living expenses and investment. This figure includes cash receipts for all farming operations (including sales of crops and livestock products) and program payments. Cash receipts include such agricultural products as field crops, vegetables, fruits, floriculture and nursery products, sod, maple and forest products, livestock, dairy products, poultry, eggs, wool, fur and honey. This figure also includes direct program payments - amounts paid under various government and private programs to individuals involved in agricultural production. The payments related to current agricultural production include subsidies to encourage production or to compensate producers for low market returns, payments to stabilize incomes and payments to compensate producers for
 on these farm operations - is included.
vi Realized Net Farm Income: Measure of net returns from farming operations (excluding value of change in inventories) that are immediately available to farm operators and unpaid family workers for living expenses. This
 tear, and obsolescence. It represents the value of capital that is no longer available for future use. Building depreciation estimates the depreciation of farm buildings on owner-occupied farms, including the farm business share of houses. Autos, trucks and machinery that are leased are not included in these figures. Operating expenses include business costs incurred by farm operators for goods and services used in the production of agricultural commodities.

#### Abstract

ii Total Net Income: Realized Net Income minus value of inventory change. The value of inventory change measures the value of the change in producer-owned inventories between the beginning and the end of the calendar year. The annual value of inventory change (whether positive or negative), along with farm cash receipts and income in kind, represents the gross value of agricultural production. Many agricultural commodities, particularly grains, are produced in a given year and stored or held until they are marketed as long as two years later. In years of above average production, farm inventories tend to be built up, only to be drawn down and sold when production returns to average or below-average levels. Receipts from the sale of grains can be deferred and then cashed or liquidated in the next year. As a result of the methods used to derive grain receipts, a adjustment is made to the value of inventory change. The adjustment is required in order to avoid double counting in the value of inventory change series. The value of inventory change is estimated for wheat, durum wheat, oats, barley, rye, corn, flaxseed, canola, soybeans, potatoes, tobacco, mustard seed, sunflower seed, lentils, canary seed, dry peas, cattle, calves, sheep and lambs, hogs, hens, chickens and turkeys. Deferred grain receipts and liquidations of deferred grain receipts are also included.

vii 'Farm population' refers to all persons who are members of a farm operator's household, living on a farm in a rural or urban area.
vii 'Improved farmland' comprises land under crops, improved pastures and summer fallow.
vii Principal field crops for all three Prairie Provinces include wheat, oats, barley, rye, peas, flax, potatoes, turnips, hay, clover, fodder corn and alfalfa.
vii 'Wheat' as defined here includes spring wheat, winter wheat, and durum wheat.
vii Gross Farm Income: Income from farming operations that is immediately available for farm expenses, family living expenses and investment. This figure includes cash receipts for all farming operations (including sales of crops and livestock products) and program payments. Cash receipts include such agricultural products as field crops, vegetables, fruits, floriculture and nursery products, sod, maple and forest products, livestock, dairy products, poultry, eggs, wool, fur and honey. This figure also includes direct program payments - amounts paid under various government and private programs to individuals involved in agricultural production. The payments related to current agricultural production include subsidies to encourage production or to compensate producers for low market returns, payments to stabilize incomes and payments to compensate producers for
 on these farm operations - is included.
vii Realized Net Farm Income: Measure of net returns from farming operations, excluding value of change in inventories, that are available immediately to farm operators and unpaid family workers for living expenses. This
 tear, and obsolescence. It represents the value of capital that is no longer available for future use. Building depreciation estimates the depreciation of farm buildings on owner-occupied farms, including the farm business share of houses. Autos, trucks and machinery that are leased are not included in these figures. Operating expenses include business costs incurred by farm operators for goods and services used in the production of agricultural commodities.

#### Abstract

vii Total Net Income: Realized Net Income minus value of inventory change. The value of inventory change measures the value of the change in producer-owned inventories between the beginning and the end of the calendar year. The annual value of inventory change (whether positive or negative), along with farm cash receipts and income in kind, represents the gross value of agricultural production. Many agricultural commodities, particularly grains, are produced in a given year and stored or held until they are marketed as long as two years later. In years of above average production, farm inventories tend to be built up, only to be drawn down and sold when production returns to average or below-average levels. Receipts from the sale of grains can be deferred and then cashed or liquidated in the next year. As a result of the methods used to derive grain receipts, a adjustment is made to the value of inventory change. The adjustment is required in order to avoid double counting in the value of inventory change series. The value of inventory change is estimated for wheat, durum wheat, oats, barley, rye, corn, flaxseed, canola, soybeans, potatoes, tobacco, mustard seed, sunflower seed, lentils, canary seed, dry peas, cattle, calves, sheep and lambs, hogs, hens, chickens and turkeys. Deferred grain receipts and liquidations of deferred grain receipts are also included.

${ }^{n i}$ 'Farm population' refers to all persons who are members of a farm operator's household, living on a farm in a rural or urban area.
${ }^{\text {vin }}$ 'Improved farmland' comprises land under crops, improved pastures and summer fallow.
ii Principal field crops for all three Prairie Provinces include wheat, oats, barley, rye, peas, flax, potatoes, turnips, hay, clover, fodder corn and alfalfa.
vii 'Wheat' as defined here includes spring wheat, winter wheat and durum.
vii Gross Farm Income: Income from farming operations that is immediately available for farm expenses, family living expenses and investment. This figure includes cash receipts for all farming operations (including sales of crops and livestock products) and program payments. Cash receipts include such agricultural products as field crops, vegetables, fruits, floriculture and nursery products, sod, maple and forest products, livestock, dairy products, poultry, eggs, wool, fur and honey. This figure also includes direct program payments - amounts paid under various government and private programs to individuals involved in agricultural production. The payments related to current agricultural production include subsidies to encourage production or to compensate producers for low market returns, payments to stabilize incomes and payments to compensate producers for
 on these farm operations - is included.

tear, and obsolescence. It represents the value of capital that is no longer available for future use. Building depreciation estimates the depreciation of farm buildings on owner-occupied farms, including the farm business share of houses. Autos, trucks and machinery that are leased are not included in these figures. Operating expenses include business costs incurred by farm operators for goods and services used in the production of agricultural commodities
vii Total Net Income: Realized Net Income minus value of inventory change. The value of inventory change measures the value of the change in producer-owned inventories between the beginning and the end of the calendar year. The annual value of inventory change (whether positive or negative), along with farm cash receipts and income in kind, represents the gross value of agricultural production. Many agricultural commodities, particularly grains, are produced in a given year and stored or held until they are marketed as long as two years later. In years of above average production, farm inventories tend to be built up, only to be drawn down and sold when production returns to average or below-average levels. Receipts from the sale of grains can be deferred and then cashed or liquidated in the next year. As a result of the methods used to derive grain receipts, an adjustment is made to the value of inventory change. The adjustment is required in order to avoid double counting in the value of inventory change series. The value of inventory change is estimated for wheat, durum wheat, oats, barley, rye, corn, flaxseed, canola, soybeans, potatoes, tobacco, mustard seed, sunflower seed, lentils, canary seed, dry peas, cattle, calves, sheep and lambs, hogs, hens, chickens and turkeys. Deferred grain receipts and liquidations of deferred grain receipts are also included.
